Business partner data: connected by agents, secured by CDQ

Case Study: Trusted business partner data for AI agents

AI agents are only as reliable as the data behind them

The challenge and the requirements

THE CHALLENGE

Companies are building their own AI agents and chatbots to process invoices, answer questions from internal knowledge and extract data from documents. The ambition is clear: faster processes, less manual work and better decisions.

Yet every one of these agents depends on business partner data. An outdated supplier record leads to a wrong invoice. Incorrect bank details put payments at risk. Missing evidence weakens compliance decisions.

For companies with large business partner bases, the gap keeps growing. New partners join all the time, existing records change constantly and manual stewardship cannot keep pace.

THE REQUIREMENTS

- **A clean foundation**
  Existing records free of duplicates, corrected and verified.
- **Data that stays current**
  Changes in official registers detected and reflected.
- **Verified onboarding**
  Every new business partner checked against trusted sources, with evidence.
- **Seamless integration**
  Works with the company's own agents, without a new platform.

How CDQ supports

STEP 1

CDQ GET CLEAN

Every reliable process starts with clean data. Yet in many companies, business partner records have grown over years across different systems, teams and countries. Duplicates, outdated addresses and missing identifiers are the result.

A CDQ Get Clean project cleans up this existing data. It finds duplicates, corrects outdated details, verifies identities and enriches records against CDQ's trusted reference data.

The result is a solid foundation before any agent starts working with the data. Instead of repeating old errors, agents start from records that are accurate, complete and verified.

STEP 2

CDQ ALL TIME RIGHT

Clean data does not stay clean on its own. Companies relocate, merge, rebrand or change their legal form, often without informing their business partners.

CDQ All Time Right monitors business partner data continuously and flags changes to legal names, addresses, legal forms or company status as soon as official registers report them.

Updates confirmed by members of the CDQ Data Sharing Community strengthen the data for everyone. Member identities stay anonymous and every shared update is reviewed by a second member before it is distributed.

STEP 3

CDQ GENIUS

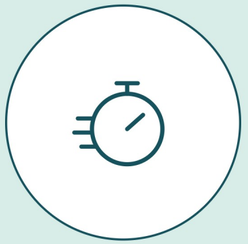

CDQ Genius, the digital data steward for business partner data, connects directly to the company's own agent through agent to agent communication. No new interface is needed.

When a new business partner needs to be onboarded, the agent asks Genius. Genius identifies the company in official registers, validates the record against CDQ's data quality rules, enriches missing identifiers such as VAT numbers and returns an answer with its sources.

It can also screen business partners for sanctions and AML risk. Every answer is cited and trust graded.

Trusted data, ready for every agent

The outcome

Speed

Faster onboarding

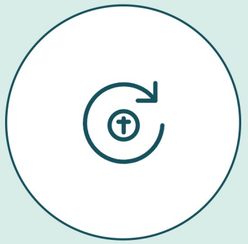

New business partners are verified at entry, not corrected later

Trust

Answers with evidence

Every result is backed by trusted sources and ready for audits

Efficiency

Less manual stewardship

Data stays clean and current without constant manual effort

Your agent asks. Genius answers. With evidence.

No new platform, no migration, no rebuild. Trusted business partner data flows into the tools companies already use.

Get Clean. All Time Right. Genius.
